

Micro-Partitions and Data Clustering

SNOWFLAKE ARCHITECTURE

Emily Melhuish

Technical Curriculum Developer,
Snowflake

Querying a Large Table

Example: Subscription

USER_ID	REGISTRATION_DATE	USER_NAME
912930	2026-04-01	JANEDOE
912931	2026-04-06	JOHNDOE
912932	2026-04-12	JIMMYDOE
...	...	...

How much data does the query need to read from this table?

Micro-Partitions

Input Files					
MONTH	LNAME	ORDER_TOT	}	Data stored in micro-partitions, with column data together	
Jan	Wiggins	1034.22		MONTH: Jan Jan Jan	
Jan	Brown	99.95		LNAME: Wiggins Brown Nguyen	
Jan	Nguyen	2044.56		TOTAL: 1034.22 99.95 2044.56	
Feb	Belehrad	100.34	}	MONTH: Feb Feb Feb	
Feb	Wilson	2134.45		LNAME: Belehrad Wilson Lopez	
Feb	Lopez	3308.24		TOTAL: 100.34 2134.45 3308.24	
Mar	Cooper	34.98	}	MONTH: Mar Mar Mar	
Mar	Zelen	1566.90		LNAME: Cooper Zelen Aziz	
Mar	Aziz	804.28		TOTAL: 34.98 1566.90 804.28	

- Within micro-partitions columns are stored and compressed separately
- Snowflake only reads columns the query needs

Metadata

Input Files			Data stored in micro-partitions, with column data together		Metadata	
MONTH	LNAME	TOTAL			Min	Max
Jan	Wiggins	1034.22	{	MONTH: Jan Jan Jan	Jan	Jan
Jan	Brown	99.95		LNAME: Wiggins Brown Nguyen	Brown	Wiggins
Jan	Nguyen	2044.56		TOTAL: 1034.22 99.95 2044.56	99.95	2044.56
Feb	Belehrad	100.34	{	MONTH: Feb Feb Feb	Feb	Feb
Feb	Wilson	2134.45		LNAME: Belehrad Wilson Lopez	Belehrad	Wilson
Feb	Lopez	3308.24		TOTAL: 100.34 2134.45 3308.24	100.34	3308.24
Mar	Cooper	34.98	{	MONTH: Mar Mar Mar	Mar	Mar
Mar	Zelen	1566.90		LNAME: Cooper Zelen Aziz	Aziz	Zelen
Mar	Aziz	804.28		TOTAL: 34.98 1566.90 804.28	34.98	1566.90

- Snowflake stores metadata for each micro-partition
- Stored in the cloud services layer

Partition Pruning

```
SELECT * FROM sales WHERE month = 'May' ;
```

Min	Max	Min	Max	Min	Max	Min	Max
Jan Brown 99.95	Jan Wiggins 2044.56	Apr Clark 103.22	Apr Patel 2204.33	Jul Adams 1103.22	Jul Wang 21990.23	Oct Adamos 35.12	Oct Yamamoto 10335.22
Feb Belehrad 100.34	Feb Wilson 3308.24	May Bigliani 99.25	May Tessay 14002.34	Aug Byrne 104.45	Aug Visser 2210.34	Nov Barac 228.34	Nov Shevchenko 1992.45
Mar Aziz 34.98	Mar Zelen 1566.90	Jun Blanchet 9.92	Jun Volkov 1002.34	Sep Accola 12.34	Sep Zhang 998.22	Dec Castillo 436.22	Dec Palakiko 1099.45

Partition Pruning

Min Jan Brown 99.95 Max Jan Wiggins 2044.56	Min Apr Clark 103.22 Max Apr Patel 2204.33	Min Jul Adams 1103.22 Max Jul Wang 21990.23	Min Oct Adamos 35.12 Max Oct Yamamoto 10335.22
Min Feb Belehrad 100.34 Max Feb Wilson 3308.24	Min May Bigliani 99.25 Max May Tessay 14002.34	Min Aug Byrne 104.45 Max Aug Visser 2210.34	Min Nov Barac 228.34 Max Nov Shevchenko 1992.45
Min Mar Aziz 34.98 Max Mar Zelen 1566.90	Min Jun Blanchet 9.92 Max Jun Volkov 1002.34	Min Sep Accola 12.34 Max Sep Zhang 998.22	Min Dec Castillo 436.22 Max Dec Palakiko 1099.45

- Snowflake skips micropartitions that can't possibly contain the data your query needs.
- It only reads the relevant slices = partition pruning

Clustering

Input Files			Data stored in micro-partitions, with column data together		
MONTH	LNAME	ORDER_TOT	MONTH: Jan Jan Jan		
Jan	Wiggins	1034.22	LNAME: Wiggins Brown Nguyen		
Jan	Brown	99.95	TOTAL: 1034.22 99.95 2044.56		
Jan	Nguyen	2044.56			
Feb	Belehrad	100.34	MONTH: Feb Feb Feb		
Feb	Wilson	2134.45	LNAME: Belehrad Wilson Lopez		
Feb	Lopez	3308.24	TOTAL: 100.34 2134.45 3308.24		
Mar	Cooper	34.98	MONTH: Mar Mar Mar		
Mar	Zelen	1566.90	LNAME: Cooper Zelen Aziz		
Mar	Aziz	804.28	TOTAL: 34.98 1566.90 804.28		

- Date-based queries often prune well (for example, time series)
- Pruning is not useful for values that are scattered across partitions (for example, region)
- **Clustering key:** Snowflake organizes micro-partitions around that column

Clustering Key: When to Use

Checklist

- Large tables (100GB+)
- Consistently filtering on the same column
- Poorly clustered column

Clustering Key: Cardinality and Cost

Cardinality

sweet spot — not too few, not too many

Column	Distinct values	Good?
region	5–20	Yes
country	50–200	Yes
customer_id	millions	No
is_active	2 (boolean)	No

too low ← sweet spot → too high

Cost

automatic reclustering uses serverless compute

New data arrives

clustering depth degrades

Snowflake reclusters

serverless — not your warehouse

Added to your bill

ongoing background credit usage

Only cluster when:

query savings > reclustering cost
large table + frequent filtered queries

Let's practice!
SNOWFLAKE ARCHITECTURE

Table Types and Views

SNOWFLAKE ARCHITECTURE

Snowflake

Table Types and Views

SNOWFLAKE TABLE TYPES

Permanent

Transient*

Temporary

VIEW TYPES

View

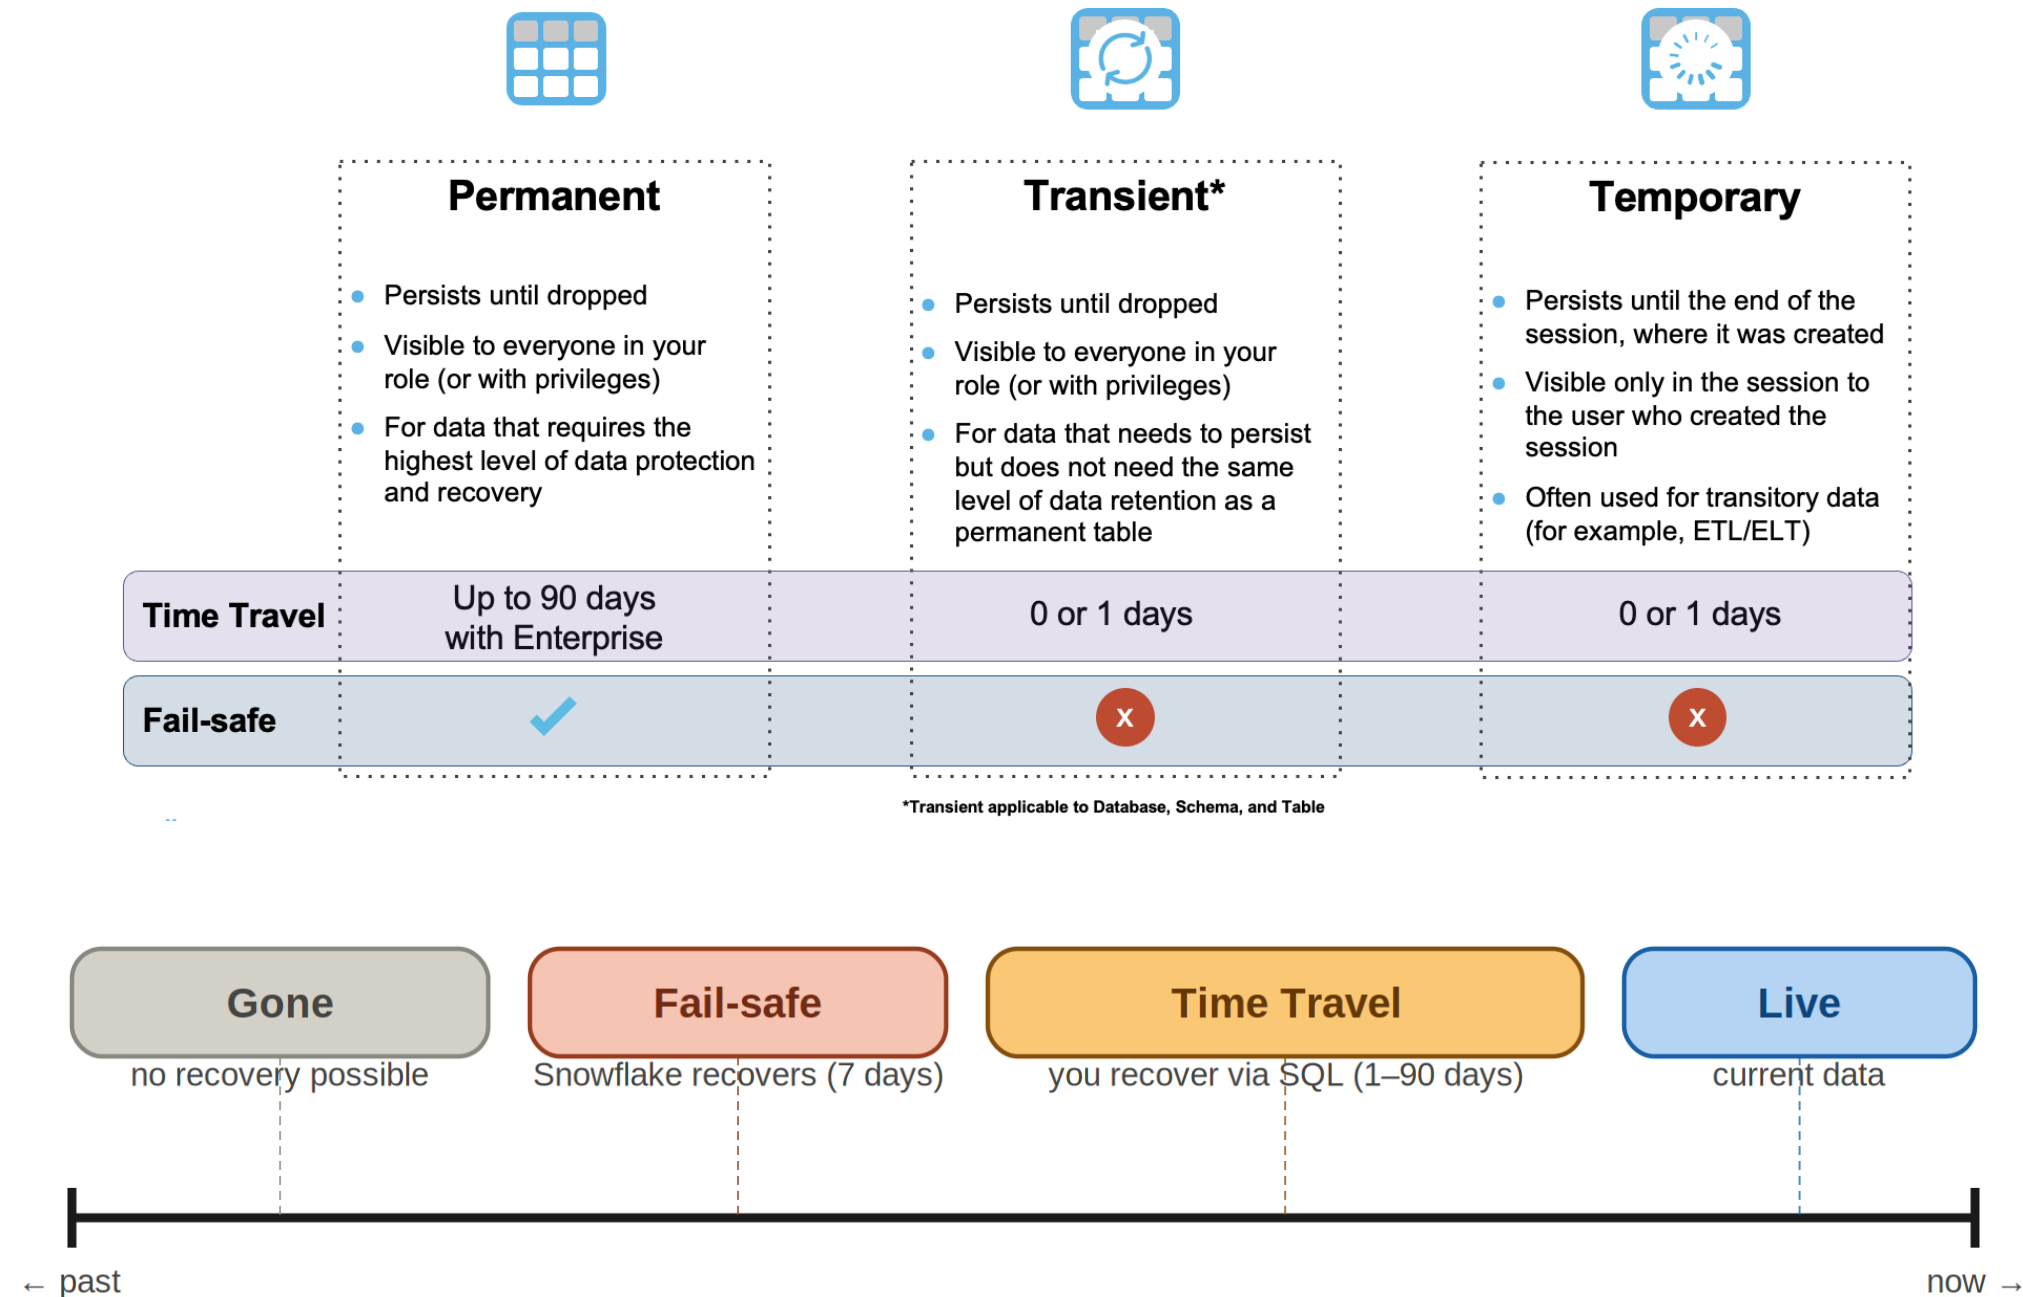

Materialized View

Secure your views

Permanent, Transient and Temporary

Permanent, Transient and Temporary

Dynamic, External, and Hybrid

Dynamic

- Materializes results of a query
- Privileges assigned to create and/or work with dynamic tables
- Table automatically kept up to date based on user-specified lag time

External

- Persists until dropped
- Visible to everyone in your role (or with privileges)
- Data accessed via an external stage
- Read-only

Hybrid

- Persists until dropped
- Visible to everyone in your role (or with privileges)
- Optimized for hybrid transactional and operational workloads

Time Travel	✓	✗	✓
Fail-safe	✓	✗	✗

Dynamic, External, and Hybrid

Apache Iceberg™

Apache Iceberg™ Snowflake managed

- Persists until dropped
- Visible to everyone in your role (or with privileges)
- Data and metadata stored on an external volume
- Snowflake managed catalog
- Full platform support

Time Travel

Fail-safe

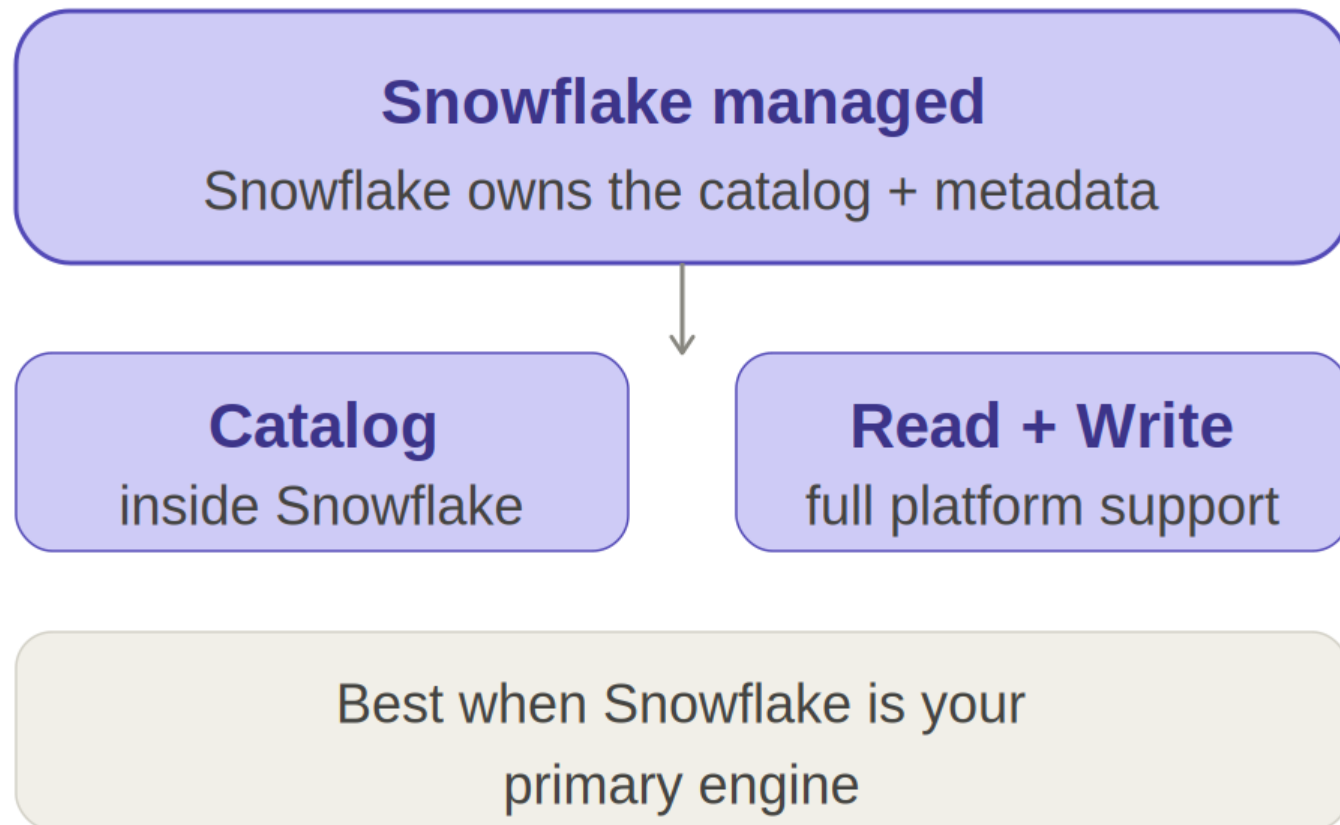

Apache Iceberg™ Externally managed

- Persists until dropped
- Visible to everyone in your role (or with privileges)
- Data and metadata stored on an external volume
- Externally managed catalog
- Read-only

Apache Iceberg™

Time Travel and Fail-safe (with table types)

Time Travel

- Way to recover data

Fail-safe

- Separate, short safety net after that window

Standard View and Materialized View

View

- Default view type
- Named definition of a query
- Results are generated at run time

Materialized View

- Results generated at creation time
- Stores results using micro-partitions
- Auto-refreshed

Secure View

View

- Default view type
- Named definition of a query
- Results are generated at run time

Materialized View

- Results generated at creation time
- Stores results using micro-partitions
- Auto-refreshed

Secure your views

- By default, View DDL is visible to any role with access
- Views and materialized views both support a secure version
- Secure view definition and details only visible to authorized users
- Snowflake query optimizer bypasses some of the optimizations used for regular views

Let's practice!
SNOWFLAKE ARCHITECTURE

Working with Unstructured Data

Beyond Tables

Stages: The Landing Zone for Files

- Internal: Managed by Snowflake
- External: Files in the Cloud
- unstructured data lives in a stage

External stage

Directory Tables

Directory Tables Syntax

ENABLE DIRECTORY

```
CREATE STAGE snowy_peak_files_stage  
  DIRECTORY = (ENABLE = TRUE);
```

Refresh directory metadata (ALTER STAGE)

```
ALTER STAGE snowy_peak_files_stage REFRESH;
```

Directory Tables

Querying a Directory Table

SQL

```
SELECT
file_name
, size
, last_modified
FROM DIRECTORY(@snowy_peak_files_stage);
```

- Audit files in the stage
- Identify stale files
- Feed downstream processes

Pre-signed URLs

- External partners and applications cannot access a stage
- Snowflake can expose URL or credentials to grant partners access: Stage URLs, scoped file URLs, pre-signed URLs and related helpers

SQL

```
SELECT GET_PREIGNED_URL(@snowy_peak_files_stage, 'avalanche_forecast.pdf', 3600);
```

- You pass stage, file path and lifetime in seconds
- Useful for partners who do not have Snowflake logins

Let's practice!
